BIRDS IN THE SAGINAW BAY AREA

August 1 through November 30, 1992

Compiled by: Ron Weeks

4111 Robinhood Terrace Midland, MI 48642 (517) 835-1939

Summary:

This fall a record 246 species were reported from the SBA area. Very thorough coverage by a few diligent observers led to records of several relatively common species not normally reported for the fall period (i.e. Acadian Flycatcher, Willow & Alder Flycatchers, Grasshopper Sparrow, Henslow's Sparrow, etc.). The only stunning rarity was a report of a Northern Gannet from the Thumb. "Good" birds not seen every fall included Red-throated Loon, Snowy Egret, Greater White-fronted Goose, Willet, Whimbrel, Buff-breasted Sandpiper, Western Sandpiper, an amazing eleven Franklin's Gulls, an unidentified Jaeger, Prairie Warbler, and Cerulean Warbler.

In all migrant waterbird populations appeared near normal with the exception of the usual late fall concentrations of gulls and divers. Some attributed this to a lack of fish in the Bay. Other possibilities include the severe summer many birds had to endure in the Arctic affecting numbers and migration routes and times. Passerine numbers appeared to be at or above normal with large numbers of thrushes being recorded this fall. Peregrines were again common this fall with eight reported. Snowy Owls also made a good showing with seven sightings. Carolina Wrens continue to do well as a result of mild winters. Ravens were once again detected south of normal in Saginaw County, an Eared Grebe made the usual fail stay in Midland, and Lesser Black-backed Gull was again reported from Bay City State Park.
