Summary: A total of 248 species from the Michigan Bird List were reported in the SBA this autumn, continuing the recent above average trend, (the 1989 - 2013 seasonal average equals 236). This report lists each of these species, along with the highest reported individual count for each, first and last dates as applicable, and the SBA counties in which each was noted. The exception to this is Trumpeter Swan. Per request of the state seasonal compiler, all records submitted for this species are, in general, listed, which is becoming a lengthy list these days. Each county had at least one observer reporting from it. Bay, Huron, Iosco, Midland and Saginaw Counties were well covered, Arenac and Tuscola less so. The total number of observers of record was down just slightly from last autumn. Higher water levels in the Lake Huron had an obvious effect of reducing the number of shorebirds stopping over in the SBA this fall. The other climatic event of note was an unseasonable cold spell in November, the result of Typhoon Nuri pushing arctic air farther south than normal. This could well have put the kibosh on any thoughts birds had for lingering late, and only two new fall late dates were recorded. Numbers-wise, five new all-time peak counts were recorded, two of them from encounters with the spectacularly large flocks of migrating flocks of birds that occur in and along Huron County's shoreline, (flocks that now face significant loss of life at the hands of large scale wind turbines that are being placed in locations outside of U.S. Fish & Wildlife Service's bird protection guidelines). Rarity-wise, four species on the MBRC Review List were reported.

This report, as well as previous seasonal reports from 2000-2014, can be found at <http://www.saginawbaybirding.org>, along with updates on winter 2014-2015 migration in the Saginaw Bay Area, as reported to Joe Soehnel at saginawbaybirding@gmail.com or at 989-892-3687.

Many thanks to all observers who contributed their sightings directly to this compilation. Your efforts result in a significantly more accurate and thorough report. And, as always, a special thanks to Joe Soehnel for his ongoing input.

AMERICAN ROBIN:	6323	10/17	Rush Lake SGA, Hu	MKE - new SBA peak count - the observer noted "Wickedly fast-flying, the birds were riding the front edge of the giant warm front. I counted them as they crossed over the road at an average height of 200 feet, over a span of 24 minutes. Numbers slowed after the leading edge of the front passed; the remaining travelers came down to roost or, perhaps, just rest at 6:40. The stream of birds was a tenth of a mile wide. The birds were largely silent with a few birds vocalizing." - also noted in Ar,Ba,Io,Mi,Sa,Tu

TOTAL: 248 Species

*Michigan Review List Species. Inclusion of records for these species in this report does not signify that they have been verified, only that an encounter was reported. The observation will not be considered an official SBA record until it has been reviewed and accepted by the Michigan Bird Records Committee (MBRC).

Peak counts and early/late dates are designated such based upon records established in the publication *Birds and Bird Finding in the Saginaw Bay Area* by Ron Weeks, published in 1995, and subsequent updates to the data by the compilers of the *Birds in the Saginaw Bay Area* report. Comments on seasonal occurrences also relate to information found in this exhaustively researched book, as well as species notations on the Michigan Bird Survey Form.
